Start by placing two counters (blue and green) on the blue one and the green number one.

**Player 1** leaves the counter on the green one in place and chooses to move the counter in the blue numbers to any number. They find the product of the two numbers and cover the product in the grid with a counter.

**Player 2** leaves the blue counter in place and moves the green one. They find the product of the two numbers and cover the product in the grid with a counter.

Play continues with player one only moving the blue counter but finding the product of the two numbers and player two only moving the green counter but finding the product of the two numbers until one player has four counters in a row.
